

## 10 reasons to adopt the NORWECO **HYDRO-KINETIC**<sup>®</sup> Wastewater Treatment System for isolated dwellings

1. High-performance hybrid process using the combination of an aerated biological reactor and biofiltration on sustainable synthetic support. This is the improved version of a process that has been successfully used in septic systems for more than 50 years in Canada and the United States;
2. No clogging nor media replacement;
3. No septic tank required. The system is pumped out only when needed. This represents hundreds of dollars in savings for the owner;
4. The only technology that retains its guarantee even if a drinking water treatment device, such as a water softener, is installed<sup>1</sup>;
5. Offered in several versions and compatible with the most difficult terrain to give the maximum value to your property;
6. Our granular phosphorus removal filter is 100% passive, 100% without electricity, 100% odorless, 100% without chemical product and does not generate sludge;
7. The annual maintenance is done by **INDEPENDENT** qualified professionals from our company. No monopoly. No exclusive territory. The client is free to choose the professional of his choice;
8. No component located inside the residence. The customer does not have to be present or take time off work for the inspection;
9. Reduced sludge volume that can result in up to 50% savings on operation and maintenance costs. In addition, this decreases the environmental footprint by reducing the volume of sludge to be transported and managed at regional treatment sites;
10. Ideal solution for the protection of our lakes, rivers and drinking water resources given its performance in nitrogen, phosphorus as well as the removal of coliform bacteria.
